Claim 6; Fig 13B; 45pp; English.

A cDNA clone (762843) codes for a novel human oestrogen recepto: related nuclear receptor (W13724), designated ER-beta. It was isolated from a human testis cDNA library using rat ER-beta cDN (see also T62842) as probe. The human ER-beta gene was mapped to chromosome 14 region 14q22-23. Rat, human and mouse ER-beta (W14723-25) can be used to isolate molecules for use in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Homo

DNA encoding estrogen recidentify novel ligands of Claim 5; page 13-14; 45pg
                                                                                                                           DNA encoding estrogen receptor - useful in screening assay to identify novel ligands or hormonal analogues claim 5; Page 13-4; 45pp; English.

This sequence encodes a novel oestrogen binding protein. The cDNA sequence which encodes this protein can be alternatively spliced resulting in the detection of additional transcripts (see T88413) This receptor is able to bind and be activated by estradiol, esto estriol, can be used in a screening assay for the identification drugs e.g. novel ligands or hormonal analogues.

                                                                          DNA encoding estrogen receptor - useful in screening assay to identify novel ligands or hormonal analogues

PT identify novel ligands or hormonal analogues

PS Claim 5; Page 14-15; 45pp; Emglish.

CLaim 5; Page 14-15; 45pp; Emglish.

CC This partial sequence encodes a splice variant of a novel oestrogen binding protein, detected by screening a human testis cDNA library.

CC This protein contains an alternative exon 8 (exon 8B) of the novel coestrogen receptor represented in T88412. As a consequence of the control of this exon through an alternative splicing reaction, the reading frame encoding the novel receptor is immediately terminated, creating a truncation of the carboxy terminus of the novel receptor.

CC This novel receptor is able to bind and be activated by estradiol, estone and estriol, and can be used in a screening assay for the identification of new drugs e.g. novel ligands or hormonal analogues, however this contain an AF-2 region and therefore probably lacks the ability to modulate transcription of target genes in a ligand dependent

Claim 5; Page 28-29; 45pp; English.
This sequence encodes splice variant of a novel cestrogen binding protein isolated from human thymus tissue. This protein contain an alternative exon 8 (exon 8C) of the novel cestrogen receptor represented in T88412.
This novel receptor is able to bind and be activated by estradiol, estone and estriol, can be used in a screening assay for the identification of new drugs e.g. novel ligands or hormonal analogues. This variant does not contain an AF-2 region and therefore probably lacks the ability to modulate transcription of target genes in a ligand dependent fashion.

CC A cDNA clone (T62842) codes for a novel rat oestrogen receptor-CC related nuclear receptor (W13723), designated ER-beta. A set of CC degenerate primers based on conserved sequences of the DNA-CC binding domain and ligand binding domain of nuclear receptors were CC used to amplify rat prostate cDNA. The PCR prod. was used to Screen a rat prostate cDNA library to obtain the ER-beta cDNA. CC This was then used to obtain human ER-beta cDNA (see also T62843) CC from a human testis cDNA library. Rat, human and mouse ER-beta CC (W14723-25) can be used to isolate molecules for use in the CC diseases, osteoporosis, prostate or ovarian cancer or benign CC prostatic hyperplasia and to test environmental chemicals for cestrogenic activity.

A cDNA clone (T62844) codes for a novel mouse oestrogen receptor related nuclear receptor (W13725), designated ER-beta. Rat, hu and mouse ER-beta (W14723-25) can be used to isolate molecules use in the treatment of cardiovascular diseases, central nervousystem diseases, osteoporosis, prostate or ovarian cancer or be prostatic hyperplasia and to test environmental chemicals for oestrogenic activity.

The construct was transfected into eukaryotic cells expressing the tTA transactivator (T06867) to allow tetracycline-regulated expression of the receptor. The minimal promoter PhCMV*-1 is based on the human CMV intermediate-early promoter (with enhancer region remover to a tetracycline operator, teto. The promoter is used express tTA transactivator in host cells. In clone pUHD (given in 076269), CDNA for rabbit progesterone receptor the control of PhCMV*-1.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The CDNA can be used in an expression system to express human oestrogen receptor protein. The coding sequence is operably linked control sequences compatible with eukaryotic host cells. This method allows expression under conditions which favour appropriate post-translational processing. It produces large amts. of purified proteuseful in the design of agonist and antagonist cods., for the study the mechanism of action of the steroid binding proteins in general, and for use in diagnostic assays for the proteins or antibodies to them. These assays are important in, egithed in the diagnosis of tumour sensitivities to steroid metabolism. Suitable host cells are VERO, HeLa and CHO cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Shine J;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This cDNA encodes an estrogen receptor (a member of a receptor superfamily). It is disclosed in the patent specification. The invention concerns an EAR-1r gene (human erb-A related gene) encoding a nuclear receptor protein (R71565) derived from human osteosarcoma (HOS) cells. The expression of EAR-1r is most abundant in the brain and was detected slightly in heart and placenta. The receptor protein may be used for the investigation of generation, differentiation and growth of fat soluble physiological substances. Sequence 204 BP; 59 A; 46 C; 55 G; 44 T;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                was encoding hormone receptors and the hormone receptors themselves are claimed. The DNA can be used to make the hormone receptor proteins and functional modified forms in quantities not previously possible. The receptor proteins can be used to screen cpds. for receptor-agonist or receptor-antagonist activity. They can also be used in diagnostic assays. Also claimed is pure DNA encoding oestrogen-related receptors hERR1 and hERR2 and hERR1 and hERR2. The new hERR1 and hERR2 receptors will provide the basis for development of an assay system that will lead to the identification of novel hormones.
